

STATEMENT

***Your wardrobe
reads you back.***

Pairing 30 days of passive outfit and mood data into a single honest self-portrait.

Abstract.

STATEMENT is a self reflection project that uses a webcam to track the outfits you choose everyday along with your mood as raw data and compiles 30 mornings of both into one honest self-portrait.

THE OBJECT

A camera.

THE ACTION

Capture, not curation.

THE OUTPUT

A composite Portrait.

Design Approach.

The project is grounded in fashion psychology and held to real ethical constraints.

SPECULATIVE

Current Market is Manual.

Most of the output produced in this project is mostly done manually in the current world.

ENCLOTHED COGNITION

Clothes change the wearer.

Grounded in Adam & Galinsky (2012): what we wear changes how we think and feel, not only how others see us.

DATA AS MATERIAL

Nothing new is captured.

Treats the outfit and expression you already produce each morning as material to be reflected, not new surveillance.

Data Mirror

Four moves turn 30 scattered mornings into one self-portrait.

01

GETTING DRESSED

You simply get dressed.

A morning routine, logged passively by the camera you already installed.

02

OUTFIT + MOOD

Two streams are captured.

The outfit photographed, the mood/ expression read at the same instant.

03

MIRROR

30 days are compiled.

Colour, silhouette and repetition are clustered and weighted by authenticity.

04

STATEMENT

You see yourself reflected.

The composite portrait, colour palette, and styled suggestions are revealed.

DATA

PROCESS

MIRROR

Social Relevance.

Why a device like this is worth imagining now.

SELF-KNOWLEDGE

Seeing your own pattern.

Most people can't see their own dress habits from the inside statement makes the pattern visible. It helps you build a wardrobe that is most aligned with self.

AGAINST CURATION

Set against the feed.

Where Instagram rewards the aspirational and staged, STATEMENT rewards the repeated and unguarded.

IDENTITY with AUTHENTICITY

Comfort vs. aspiration.

The gap between what you wear most and what you own reveals who you are versus who you want to become.

Data Sources.

Two passive streams the device draws on.

01

Outfit photo

Colour, silhouette,
repetition

02

Facial expression

Passive, unguarded, same
instant as capture

03

Calendar context

Flags obligated vs. freely
chosen days

The user connects their calendar to the app, which flags obligated days - meetings, interviews, and appointments

Key Features: DATA

What the device does before a STATEMENT can be revealed.

AMBIENT CAPTURE

Nothing to press.

The camera logs no new behaviour it indexes the outfit and expression you already produce.

PASSIVE MOOD READ

Unguarded, not posed.

Facial affect read the same way MoodCapture (Dartmouth, 2024) reads emotion from an ordinary camera.

PATTERN CLUSTERING

The grid does the work.

No labels, no interpretation colour clustering becomes visible on its own by day 15, with a fully analysed output by day 30.

Key Features: MIRROR

What the app offers once 30 days have been compiled.

STATEMENT

A composite portrait.

The outfit that most honestly represents 30 days of you chosen by the data, not always what you'd expect.

COLOUR ANALYSIS

Your authentic palette.

The exact tones worn on your most emotionally aligned days, extracted and named.

STYLED SUGGESTIONS

From your own wardrobe.

Other pieces you already own, matched to the palette a way to align your wardrobe with who you're becoming.

User Journey.

Six phases, from an ordinary morning to a self-portrait you didn't consciously design.

01

Dress

Lives the morning

passive · unaware

02

Tracked

Logs the daily fits

ten seconds

03

Repeat

30 mornings pass

no active effort

04

Pattern

Grid reveals
clustering

by day 15, visible

05

Reveal

STATEMENT
generated

anticipation

06

Style

Palette +
suggestions

*Data for you to
interpret*

Storyboard

10

STATEMENT DATA MIRROR STORYBOARD

A speculative system that transforms unnoticed clothing behaviour into self-reflection.

App Screens: Capture & Reveal.

PROTOTYPE

The interface screens and interactive prototype were generated using Figma Make, based on the system logic, content, and visual direction developed throughout this deck. The concept, research, and design decisions are my own.

References

What exists near this idea, and why STATEMENT sits apart from it.

WARDROBE APPS

Whering, Stylebook

inventory & suggestion, no emotional data

Smart Closet

organisation and efficiency only

MOOD TRACKERS

Daylio, Bearable

self-reported mood, no clothing data

No app pairs the two

the gap this project fills

References

The research STATEMENT is backed on,

Adam & Galinsky, Enclothed Cognition

2012 - clothing changes psychological state, not just perception.

Hester & Hehman

2023 - dress as a primary channel of person perception.

MoodCapture, Dartmouth

2024 - passive facial affect read from an ordinary camera.

Zuboff, Surveillance Capitalism

2019 - the politics of behavioural data, held in tension here.

Closing Reflection.

STATEMENT stays a mirror only as long as it resists becoming a product. The moment this is used to sell, rank or retain rather than reflect for the user it has stopped doing what it is built to do.

**“Your clothes have been telling a story about you every morning.
STATEMENT is the system that reads it back.”**
